

AKVIS Releases Magnifier AI 13.0 with a New AI-Powered Universal Enlargement Mode

June 3, 2026 — AKVIS announces the release of AKVIS Magnifier AI 13.0, an advanced image enlargement software powered by artificial intelligence. The new version introduces the innovative Universal enlargement mode that delivers sharper details, cleaner edges, and reduced noise for superior upscaling quality.

AKVIS Magnifier AI is powerful AI-driven image resizing software. The trained neural network chooses the best way to create images with perfect quality. The software easily upscales pictures to super-resolution up to 800% and produces wall-sized images.

Version 13.0 allows users to enlarge images up to 800% while preserving image quality and visual clarity. The software is designed for photographers, designers, print studios, digital artists, and anyone working with high-resolution graphics.

The new *Universal* algorithm intelligently enhances image details during enlargement while maintaining natural-looking textures and minimizing digital artifacts. Compared to the *Standard* mode, it provides improved overall quality, and compared to the *Intensified* mode, it produces more realistic photographic results.

“With the new Universal mode, users can achieve high-quality enlargements faster and more easily, even from small or low-resolution source images,” said the AKVIS team. *“The update helps create professional-looking large-format prints, posters, marketing materials, and detailed digital artwork.”*

In addition to the new enlargement algorithm, version 13.0 includes stability improvements and minor bug fixes for smoother performance.

AKVIS Magnifier AI is available as a standalone application and as a plugin for Adobe Photoshop.

The software runs on Windows 10-11, macOS 10.15- 26, and Linux (Debian/Ubuntu/Red Hat/CentOS/Fedora/openSUSE).

The product comes in Home, Home Deluxe, and Business versions (lifetime licenses), with differing levels of functionality. The Home license sells for \$ 89.00.
