# AKVIS Enhancer

## Enhance the quality of RAW and common images with this intuitive application that allows you to adjust shadows, saturation and highlights

Some of the most widely employed file formats today are pictures. From RAW formats handled by professionals to common PNGs or JPGs, one can hardly find a computer today that does not store at least a couple of such items. AKVIS Enhancer is a tool devised especially for users of such documents, as it allows them to improve the quality of source items by making quick adjustments.

### Features three tools to improve the quality of images

Specifically, it can correct shadow to light ratios, thus intensifying color transitions, as well as increase the sharpness of image borders. The tool comes with three similar, but not identical tools, "Improve detail", "Prepress", and "Tone Correction" that can be employed to make various quick adjustments to images.

These components use different algorithms to target specific parameters and one of the great features of the program is that users can apply all three tools to improve results. For example, one can adjust light levels to reveal 'hidden' photo details, as well as alter the gradient contrast to enhance the overall quality.

### Load most common standard and professional files

Other options include the ability to adjust highlights or shadows, as well as change standard brightness, contrast, and saturation parameters.

The program can load and process most common images, such as JPGs, PNGs, BMPs or TIFFs, but also specialized Canon, Panasonic, Olympus, Nikon or Kodak RAW formats. This setup ensures the utility caters both to professional, as well as more basic needs.

### A highly practical program for lightweight, but essential picture enhancements

To conclude, AKVIS Enhancer is a lightweight tool for users who regularly find themselves making minor adjustments to either RAW or common images. With it, one can adjust light or shadow parameters to improve details, as well as enhance the overall impression of a source file by correcting the gamma or brightness.
